

Wrenches

Open end wrenches

Combination wrenches

Offset ring wrenches

Slogging wrenches

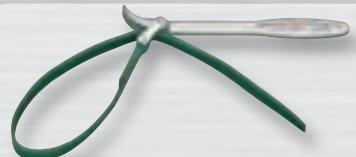

Adjustable wrenches

T-handle wrenches

Hexagon wrenches

Filter and oil drain plugs wrenches

Hook wrenches

Long lifespan

The wrenches are made of high quality chrome-vanadium steel with a greater density at the points of the highest pressure, and such dimensioning and manufacture only increase their extreme power and durability.

Safety cut

With their special safety cut, the wrenches prevent the damaging of corners and edges of the screws and nuts by distributing the force evenly over the surface away from the outer lines of the nut or screw head instead of directly on the edges.

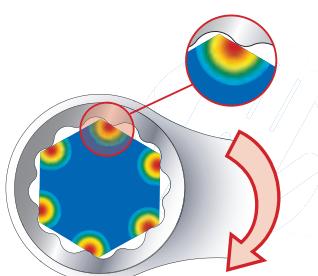

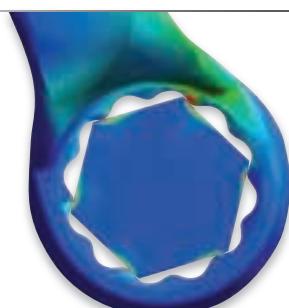

Innovative design

State-of-the art design makes Unior wrenches guarantee an accurate and efficient transfer of force to screw heads and nuts.

"LIFE profile"

Main advantages of LIFE profile

- fastens surface screws, screw-nuts in just six points
- protection of screws and screw-nuts edges
- faster position and comfortable work
- suitable also for damaged screws, screw-nuts

THE MAIN COMMANDMENTS TOWARDS PERFECTION

All technological processes of Unior hand tools manufacturing are carefully designed, rigorously checked and conform to demanding quality certifications. In addition to the best processes, the excellence of the final products is guaranteed by employment of superior quality materials and machines.

The forging of oblong products, such as wrenches, requires several characteristic preparatory and intermediate operations before the forgings can acquire their final shape. Initially, in the forging of wrenches blanks are cut from strip by means of special blades. The cut up blanks are then straightened with one or

two blows and subsequently forged to form. Since the section of the cutting blades can be set with great precision, the consumption of selected quality material is minimal.

A special procedure for the manufacture of a combination wrench 24

10 main steps out of 24

1. Cutting:

on a machine, flat steel is cut into required shapes; the accuracy of the cut ensures minimal consumption of quality material.

2. Forging:

through forging procedures performed on the renowned LASCO machines, the toughness of combined wrenches is enhanced. By the employment of suitable forging techniques we are able to maintain the appropriate fibre orientation (the same as in the rolled blanks), which is of key importance in products exposed to heavy, dynamic loads (e.g. Unior wrenches).

3. Trimming:

the removal of flash (waste material squirting out of the thin seams between the die covers under the force of the forging hammer) is carried out by a special trimming machine; the weight of the trimmings to be removed in order for the forging to acquire the desired shape always has to be lesser than the weight of the forged part.

4. Perforation:

following the forging and trimming phases, perforations are made in the workpiece by punching or cutting. This procedure can be carried out either on hot or cold workpieces.

5. Burring and grinding:

with the help of mechanical and chemical substances, the rough edges on the forgings are removed by burring machines and subsequently the wrenches are passed over grinding machines to be contoured. The surface and the edges of the wrench are thus smoothed and rounded.

6. Machine marking and bending:

in conformity with Set standards, each product is impressed with its appropriate mark; next, the ring of the wrench is offSet as per relative requirements.

7. Broaching:

in broaching, material is removed in a single pass by a successive action of a number of cutting blades incorporated in a broach. In the production of Unior wrenches, the internal teeth of the ring are made using a MAE broaching machine.

8. Tempering:

tempering by heating and cooling is designed to improve the grain flow of the steel and thereby increase the toughness of the wrench at the desired points; this heat treatment process grants the Unior wrenches a long lifespan and resistance to high loads and pressure.

9. Sanding and polishing:

various abrasive substances are blasted onto the surface of the wrenches by means of compressed air. The abrasives burr the surface, while at the same time imparting to it a certain asperity, important for the subsequent application of a suitable galvanic (protective) coating. In certain variants, the head surfaces of the wrench are polished to present a pleasant final appearance.

10. Chrome plating:

wrenches are coated with a thin, solid layer of chrome dioxide to protect them from corrosion, wear and scratches; metal chrome is used in the alloying of steel and metal plate, while also giving the wrench an attractively shiny visual aspect.

110/1

Open end wrench

- material: chrome vanadium
- surface finish: chrome plated according to EN12540
- polished head
- drop forged, entirely hardened and tempered
- made according to standard ISO 10102 (only metric dimension)

Single open end wrench

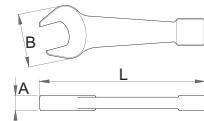

- material: chrome vanadium
- surface finish: phosphated to standard DIN 12476
- applications: In industry for working on machines, engines and other equipment.
- larger dimensions are useful in shipbuilding, the oil industry and other heavy industries where larger machines and equipment are used
- this wrench is especially suitable for work that requires higher torque and more leverage in difficult to reach areas
- drop forged, entirely hardened and tempered
- made according to standard DIN 894
